Fourier boundary null controllability results for convection-diffusion equations with application to an identification problem

Arnaud FOURNIER, LAMIA, Université des Antilles - Pointe-à-Pitre, Guadeloupe
James LARROUY, LAMIA, Université des Antilles - Pointe-à-Pitre, Guadeloupe

We study a null controllability problem for a convection-diffusion equation with the control contained in Fourier boundary condition to identify M parameters of pollution. The results are achieved by means of an observability inequality derived from new Carleman estimates for the boundary null controllability and the construction of a boundary sentinel to identify the parameters.
